

Task Distribution Document – Deliverable 1

Project Title: **SkillSwap**

Team Members: **Xingzuo Li, Joseph Wajsberg**

Task Distribution

Xingzuo Li

- **Home Screen (Landing Page) with Navigation** – Designed and implemented the UI following Material Design principles and built the navigation structure to ensure smooth transition between app sections.
- **Sign In Screen with Authentication** – Designed and implemented the login UI, and to enable secure user sign-in functionality.
- **Sign Up Screen with Account Creation** – Designed and implemented the registration UI with input validation, integrated backend account creation functionality, and connected the workflow to the Email Verification process.
- **Email Verification Screen** – Designed the verification UI and developed the backend feature to send and validate confirmation emails, improving account security.
- **Edit Profile Screen with Data Update** – Created the profile editing UI and integrated backend logic to allow users to update and save their personal information, as well as implemented the account deletion feature.
- **Matches Screen with Dynamic Data Integration** – Designed the matches UI, implemented ListView for dynamic user display, and connected it with backend matching logic.

Joseph Wajsberg

- **Complete Chat System Implementation** – Designed and developed the entire messaging functionality including chat list screen, individual chat interfaces, message composition, archived chat list screen, and real-time communication features with modern UI/UX patterns.
- **Settings and Configuration Management** – Built comprehensive settings screen with multiple subsections (account, skills, notifications, privacy, app preferences, support, legal) and implemented theme settings screen with light/dark/system mode switching.

- **UI/UX & Theming System Implementation** – Designed cohesive interfaces following Material Design 3 guidelines and built a robust theming system (light/dark/system modes) using Provider state management, ensuring accessibility, consistency, and proper dark theme compatibility across the app.
- **Project Architecture and Code Organization** – Performed major project restructuring efforts to improve maintainability, established consistent coding patterns, organized file structure, and implemented proper separation of concerns throughout the application.
- **Performance Optimization and Code Quality** – Implemented various performance improvements including efficient state management, optimized widget rendering, deprecated API migration, and established best practices for Flutter development within the project.

Conclusion

The tasks were divided equally to balance workload and ensure learning opportunities for all members. Both members contributed to coding, debugging, and documentation.
